

# Natural and Man-Made Structures

## Man Made Structure -

*adjective*

produced, formed, or made by humans.

produced artificially; not resulting from natural processes.

Examples -

# Natural Structure -

As opposed to man-made structures, natural structures are those forms that stand on their own and take a specific configuration but are not made by humans, including things like beehives, rock arches, canyons, eggshells, bird's nests, coral reefs and naturally formed caves. One way to understand natural structures is to look at the difference between natural structural phenomena such as mountain ranges compared to man-made structures such as houses and highways. Natural structures are created from the Earth's natural forces or through the efforts of animals.

Examples -

Please choose an example of your favourite natural or man-made structure and write a sentence about this in your books

For example - 'My favourite natural structure is...because...'
